SEQUENCE 1 - APPOINTMENT BOOKING AND AI TRIAGE

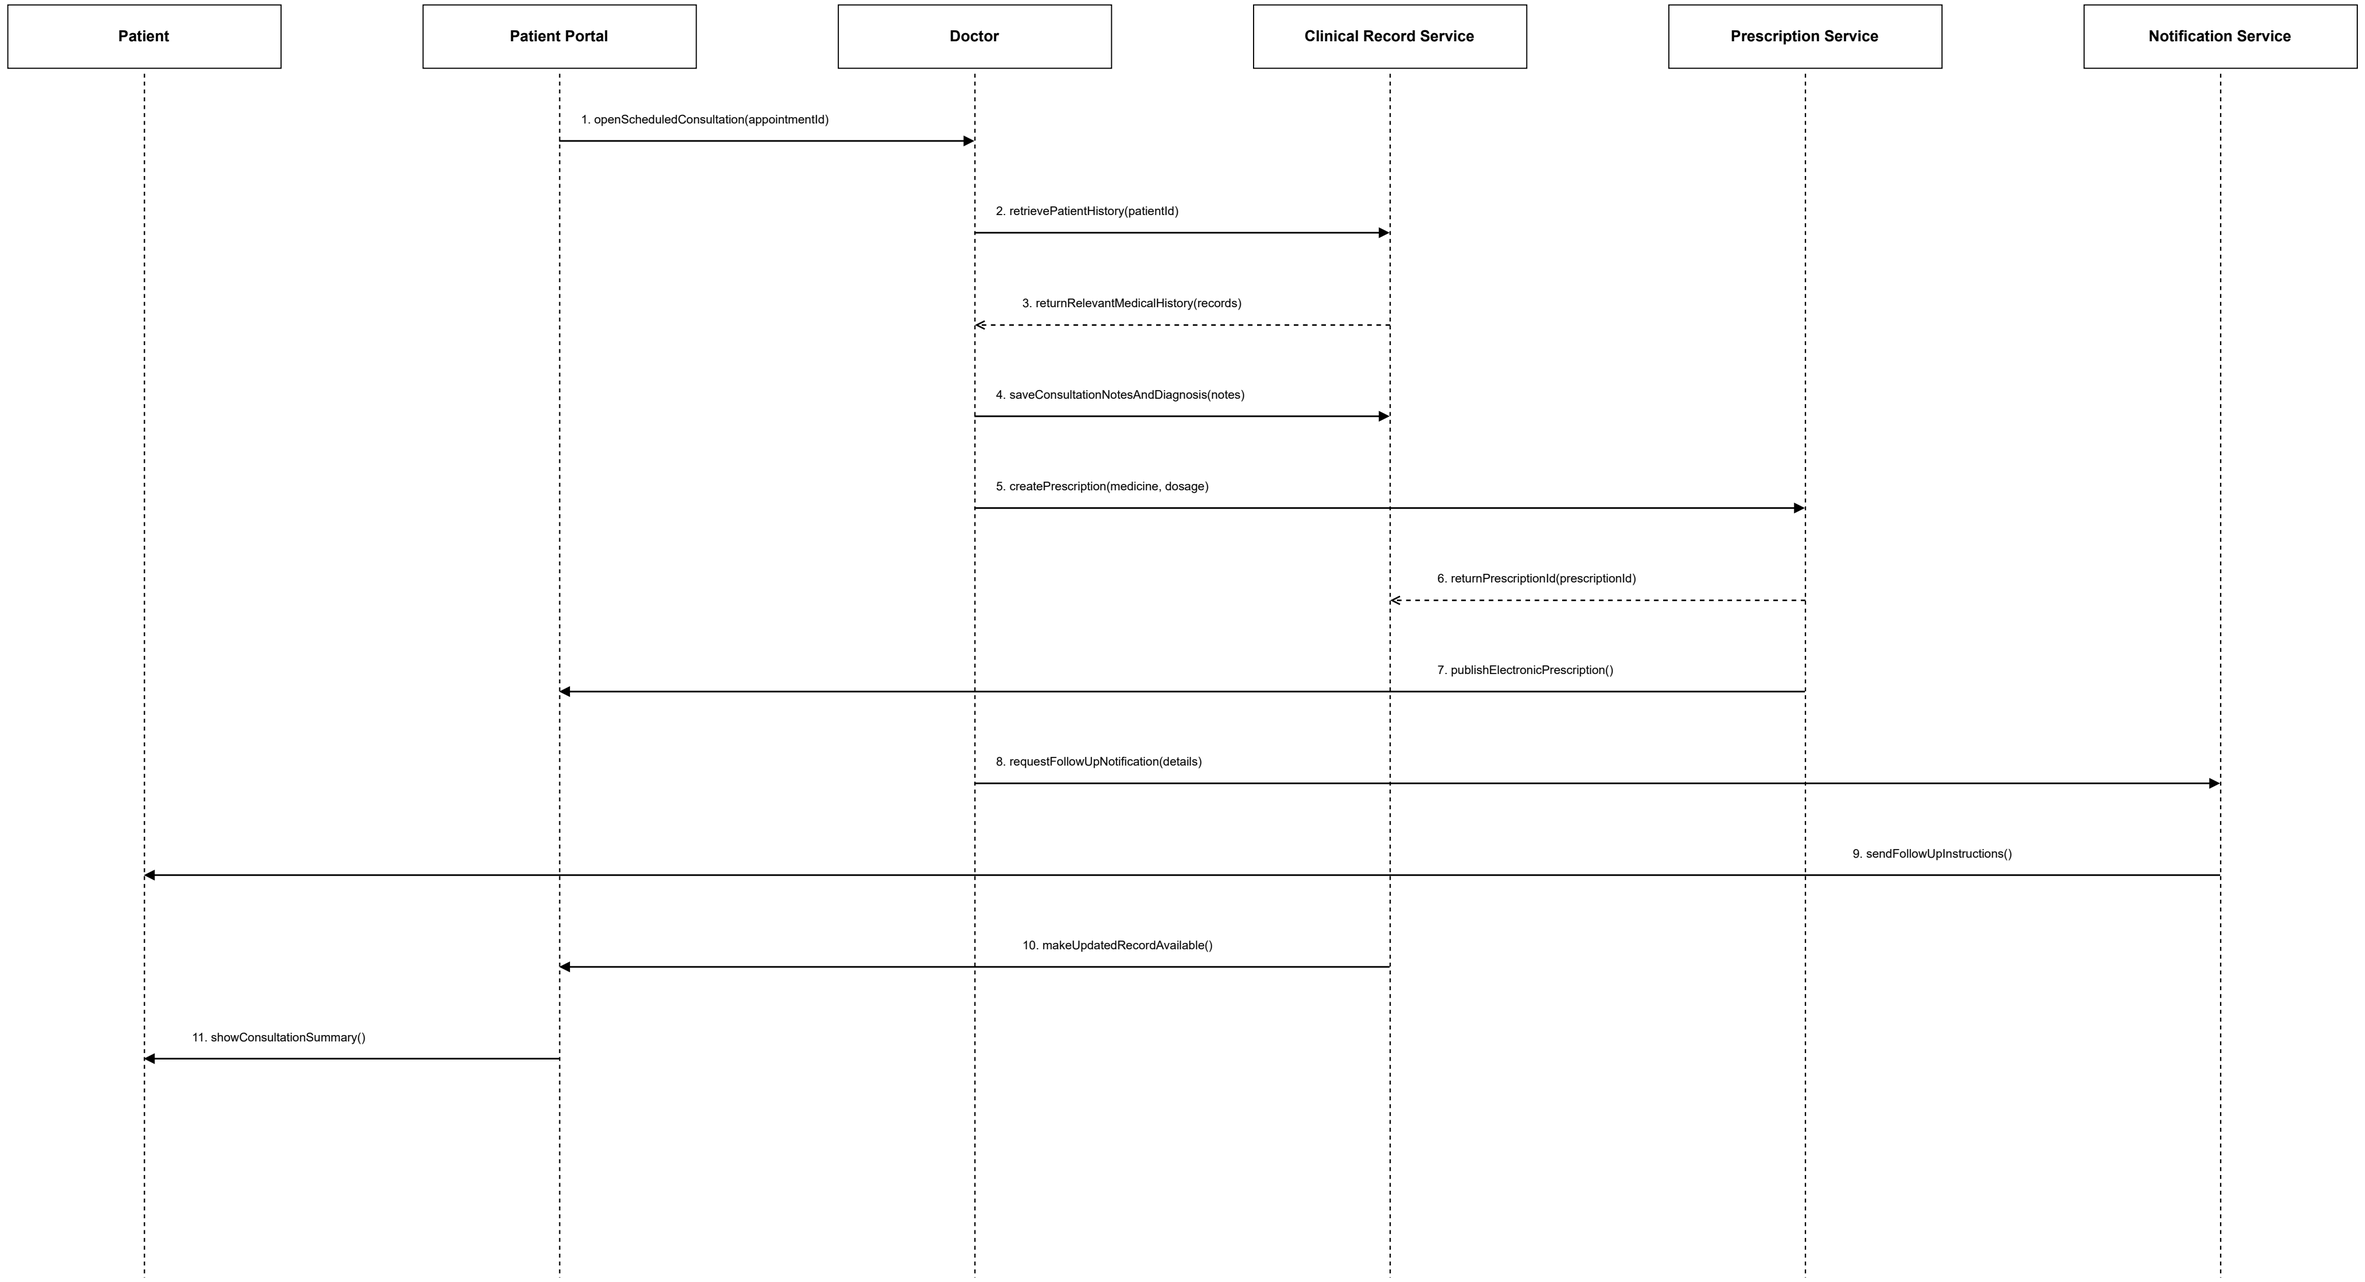

Sequence diagram • Lifelines show participants • Solid arrows = requests • Dashed arrows = responses

Alternative path: if no slot is available, the Scheduling Service returns alternatives and the patient selects another slot. AI triage offers guidance only; it does not diagnose a condition or replace a clinician.

SEQUENCE 2 - CONSULTATION AND PRESCRIPTION

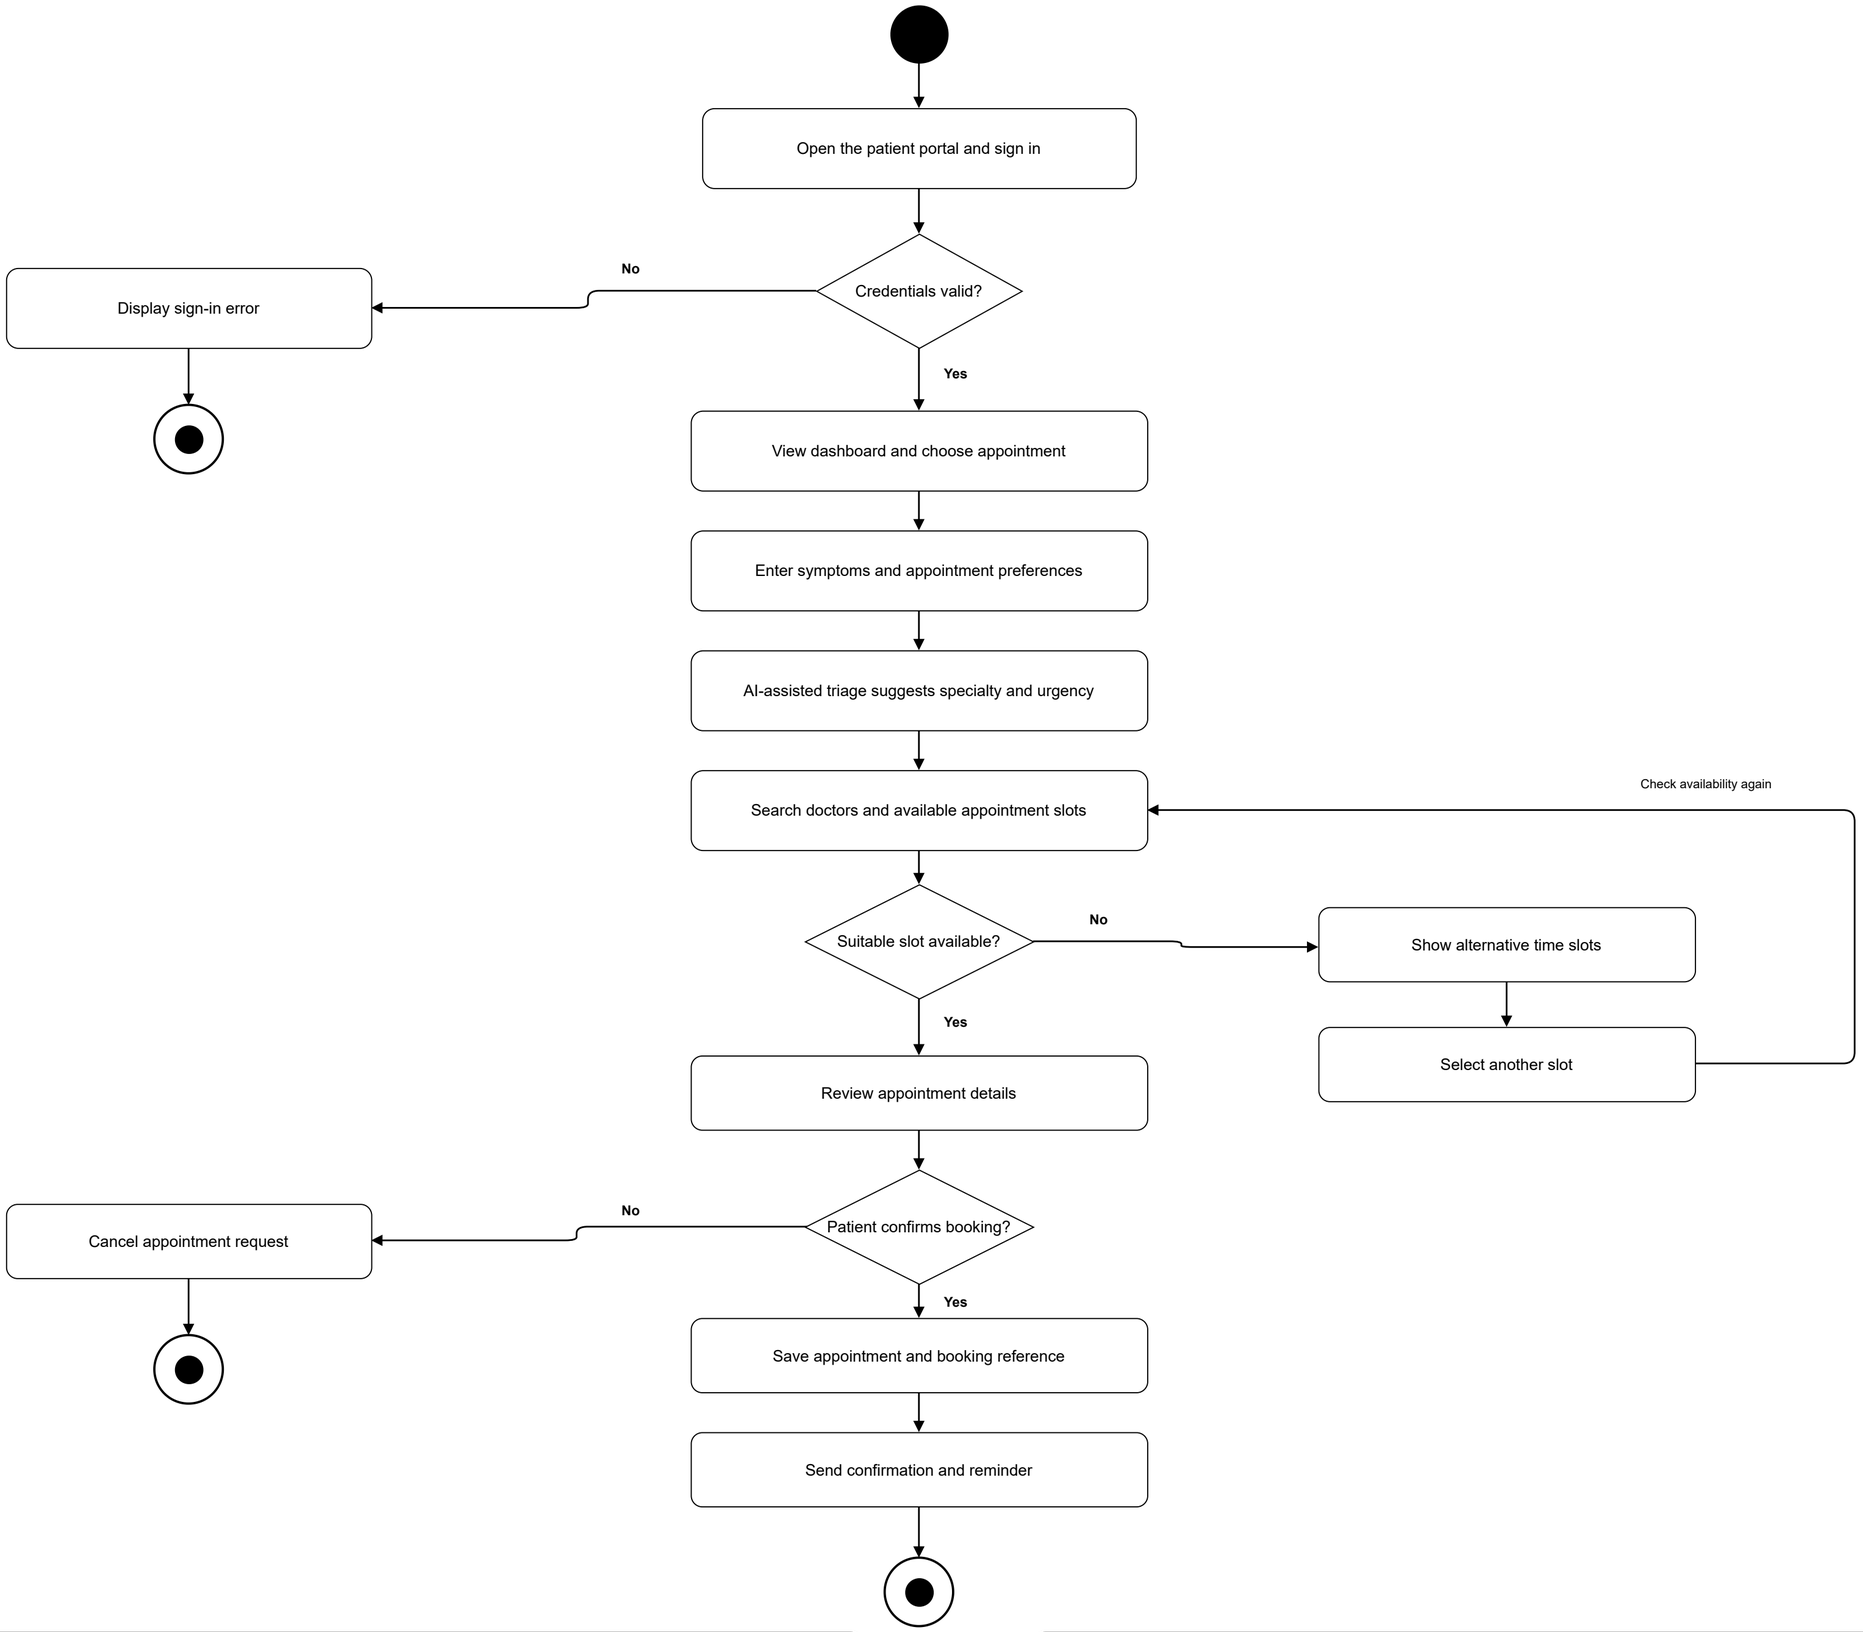

Sequence diagram • Lifelines show participants • Solid arrows = requests • Dashed arrows = responses

The doctor reviews relevant history, records the consultation, and issues a prescription when clinically appropriate. Access to records must follow the patient's permissions and hospital privacy rules.

SMART HOSPITAL MANAGEMENT SYSTEM — PATIENT APPOINTMENT WORKFLOW

UML Activity Diagram • Decisions have labelled Yes/No paths • Read from top to bottom

Notation: filled circle = start; double circle = final state; rounded rectangle = activity; diamond = decision.

Important: AI triage is advisory and must not replace medical assessment. Appointment creation should re-check slot availability at the time of confirmation to prevent duplicate bookings.
